`rinoh.frontent.sphinx` is a Sphinx extension module. It provides a Sphinx builder with the name `rinoh`. The builder recognizes the following `conf.py` options. Of these, only `rinoh_documents` (or `latex_documents`) is required.

## **`rinoh_documents`**

Determines which PDF documents to build. Its format is a list of dictionaries, one for each document to be generated. The supported keys for these dictionaries are listed below. Two of them are required:

### **`doc` (required)**

String that specifies the name of the master document (typically `index`).

### **`target` (required)**

The name of the target PDF file without the extension.

The following keys allow overriding the content included on the document's title page and page headers/footers (depending on the template and its configuration). The values for text content can be plain text or `StyledText`.

### **`logo` (no default)**

Path (absolute or relative to the location of the `conf.py` file) to an image file, typically included on the title page.

### **`title` (default: "project documentation")**

The title of the document.

### **`subtitle` (default: "Release release")**

Subtitle of the document.

### **`author` (default: "author")**

The document's author.

### **`date` (default: determined from today and today\_fmt)**

The document (build) date.

The remaining keys control what is included in the document and the document template (configuration) to use.

### **`toctree_only` (default: False)**

Must be `True` or `False`. If `true`, the document itself is not included in the output, only the documents referenced by it via TOC trees.

### **`domain_indices` (default: True)**

If `true`, generate domain-specific indices in addition to the general index. It is equivalent to the `html_domain_indices` and `latex_domain_indices` configuration variables.

### **`template` (default: Book)**

Determines the template used to render the document. It takes:

- the filename of a template configuration file,
- a `TemplateConfiguration` instance,
- the name of an installed template (see `rinoh --list-templates`), or

- a DocumentTemplate subclass

rinoh\_documents will also accept other keys than those listed above. These items will be available as document metadata and can be used in a custom document template.

Example:

```
rinoh_documents = [
    dict(doc='index', target='manual', toctree_only=False,
         template='manual.rtt', logo='logo.pdf'),
    dict(doc='ref', target='reference', title='Reference Manual',
         template='reference.rtt', stamp='DRAFT'),
]
```

### rinoh\_targets

Limits rendering to the specified set of targets. This variable accepts either a list of strings or a string containing comma-separated values. The target names should match those set in rinoh\_documents.

To render only the 'manual' target, you can set the following in conf.py:

```
rinoh_targets = ['manual']
```

The same can be achieved from the command line using the by using the string form with sphinx-build -D:

```
sphinx-build -b rinoh -D rinoh_targets="manual" source build
```

## 2.1 Legacy Configuration Variables

The configuration variables below are no longer supported. Instead, their functionality can now be configured per document in rinoh\_documents.

### rinoh\_template

This configuration variable is no longer supported since the document template can be specified in rinoh\_documents entries.

### rinoh\_stylesheet

This configuration variable is no longer supported since it is not obvious which style sheet will be used when the template configuration also specifies a style sheet. Please specify the style sheet to use in your template configuration file:

```
[TEMPLATE_CONFIGURATION]
name = My Book
template = book
stylesheet = my_stylesheet.rts
```

### rinoh\_paper\_size

This configuration variable is no longer supported since it was not obvious which paper size was being used when the template configuration (rinoh\_template) also specified a paper size. Please specify the paper\_size to use in your template configuration file:

```
[TEMPLATE_CONFIGURATION]
name = My Book
template = book

[VARIABLES]
paper_size = A5
```

**rinoh\_logo**

This configuration variable is no longer supported since the logo can be specified in the `rinoh_documents` entries.

**rinoh\_domain\_indices**

This configuration variable is no longer supported since the `domain_indices` can be specified in the `rinoh_documents` entries.

**rinoh\_metadata**

This configuration variable is no longer supported. Metadata entries can now be added to `rinoh_documents` entries.

## 3.1 Included Style Sheets

These style sheets are included with rinohtype:

`rinohtypesheets.sphinx`

Mostly a copy of the LaTeX style included with Sphinx  
Entry point name: `sphinx`

`rinohtypesheets.sphinx_article`

The Sphinx stylesheet adjusted for the article template  
Entry point name: `sphinx_article`

`rinohtypesheets.sphinx_base14`

The Sphinx stylesheet, but using the fonts from the PDF core set (yielding smaller PDF files)  
Entry point name: `sphinx_base14`

Additional style sheets can be installed from PyPI. The installed style sheets can be listed using `rinohtype --list-stylesheets`.

## 3.2 Default Matcher

The default matcher provides the selectors for the styles used in the standard style sheets.

`rinohtypesheets.matcher`

The default matcher defines the following styles

- title page rule: `HorizontalRuleStyle`
- title page logo: `FlowableStyle`

Parameters

- value (int or float) – the magnitude of the dimension
- unit (DimensionUnit) – the unit this dimension is expressed in. Default: PT.

**grow** ( *value* )

The value is interpreted as a magnitude expressed in the same unit as this dimension.

**class** rinoh.flowable.**Flowable** ( *align=None, width=None, id=None, style=None, parent=None, source=None* )

- **width** (FlowableWidth or DimensionBase) – the width of the flowable.

**class** rinoh.flowable.**FlowableState** ( *flowable, \_initial=True* )

Stores a flowable’s rendering state, which can be copied.

This enables saving the rendering state at certain points in the rendering process, so rendering can later be resumed at those points, if needed.

### 5.6.1 No-Output Flowables

These flowables do not directly place anything on the page. All except DummyFlowable do have side-effects however. Some of these side-effects affect the rendering of the document in an indirect way.

**class** rinoh.flowable.**DummyFlowable** ( *id=None, parent=None* )

A flowable that does not directly place anything on the page.

Subclasses can produce side-effects to affect the output in another way.

A dummy flowable that registers a destination anchor.

Places a destination for the flowable’s ID at the current cursor position.

**class** rinoh.flowable.**SetMetadataFlowable** ( *parent=None, \*\*metadata* )

The metadata is passed as keyword arguments. It will be available to other flowables during the rendering stage.

**class** rinoh.flowable.**WarnFlowable** ( *message, parent=None* )

A dummy flowable that emits a warning during the rendering stage.

Parameters

**message** (str) – the warning message to emit

### 5.6.2 Labeled Flowables

**class** rinoh.flowable.**LabeledFlowable** ( *label, flowable, id=None, style=None, parent=None* )

A flowable with a label.

The flowable and the label are rendered side-by-side. If the label exceeds the `label_max_width` style attribute value, the flowable is rendered below the label.

Parameters

- `label` (Flowable) – the label for the flowable
- `flowable` (Flowable) – the flowable to label

**style\_class**

alias of `rinoh.flowable.LabeledFlowableStyle`

**prepare** ( *flowable\_target* )

**render** ( *container, last\_descender, state, label\_column\_width=None, space\_below=0, \*\*kwargs* )

Renders the flowable's content to container, with the flowable's top edge lining up with the container's cursor. `descender` is the descender height of the preceding line or `None`.

**class** rinoh.flowable.**LabeledFlowableState** ( *flowable, content\_flowable\_state, \_initial=True* )

### 5.6.3 Grouping Flowables

**class** rinoh.flowable.**GroupedFlowables** ( *align=None, width=None, id=None, style=None, parent=None, source=None* )

Groups a list of flowables and renders them one below the other.

Makes sure that a flowable for which `keep_with_next` is enabled is not separated from the flowable that follows it.

Subclasses should implement `flowables()`.

**style\_class**

**flowables** ( *container* )

Generator yielding the Flowables to group

**render** ( *container, descender, state, first\_line\_only=False, \*\*kwargs* )

#### 5.6.4 Floating Flowables

**class** rinoh.flowable.**Float** ( *align=None, width=None, id=None, style=None, parent=None, source=None* )

A flowable that can optionally be placed elsewhere on the page.

If this flowable's float style attribute is set to True, it is not flowed in line with the surrounding flowables, but it is instead flowed into another container pointed to by the former's Container.float\_space attribute.

This is typically used to place figures and tables at the top or bottom of a page, instead of in between paragraphs.

**flow** ( *container, last\_descender, state=None, \*\*kwargs* )

Flow this flowable into container and return the vertical space consumed.

The flowable's contents are preceded by a vertical space with a height as specified in its style's space\_above attribute. Similarly, the flowed content is followed by a vertical space with a height given by the space\_below style attribute.

#### 5.6.5 Styling Properties

### 5.7 Fonts and Typefaces (rinoh.font)

Classes for fonts and typefaces.

**class** rinoh.font.**Font** ( *filename, weight, slant, width* )

A collection of glyphs in a particular style

This is a base class for classes that parse different font formats. See rinoh.font.type1 and rinoh.font.opentype.

#### Parameters

- filename (str) – filename of the font file to load
- weight (FontWeight) – weight of the font
- slant (FontSlant) – slant of the font
- width (FontWidth) – width of the font

#### encoding

If no encoding is set for the Font, glyphs are addressed by glyph ID (and thus support more than 256 glyphs).

#### **get\_glyph** ( *char*, *variant* )

Return the glyph for a particular character

If the glyph of requested font variant is not present in the font, the normal variant is returned instead. If that is not present either, an exception is raised.

#### Parameters

- char (str of length 1) – the character for which to find the glyph
- variant (FontVariant) – the variant of the glyph to return

#### Returns

GlyphMetrics – the requested glyph

#### Raises

MissingGlyphException – when the requested glyph is not present in the font

#### **get\_ligature** ( *glyph*, *successor\_glyph* )

Return the ligature to replace the given glyphs

If no ligature is defined in the font for the given glyphs, return None.

#### Parameters

- glyph (GlyphMetrics) – the first of the glyphs to combine
- successor\_glyph (GlyphMetrics) – the second of the glyphs to combine

#### Returns

GlyphMetrics or None – the ligature to replace the given glyphs

#### **get\_kerning** ( *a*, *b* )

Look up the kerning for two glyphs

#### Parameters

- a (GlyphMetrics) – the first of the glyphs
- b (GlyphMetrics) – the second of the glyphs

#### Returns

float – the kerning value in font units

#### **class** `rinoh.font.Typeface` ( *name*, *\*fonts* )

A set of fonts that share common design features

The fonts collected in a typeface differ in weight, width and/or slant.

#### Parameters

*\*fonts* (Font) – the fonts that make up this typeface

#### **fonts** ( )

Generator yielding all fonts of this typeface

#### Yields

Font – the next font in this typeface

**get\_font** ( *weight=400, slant='upright', width=5* )

Return the font matching or closest to the given style

If a font with the given weight, slant and width is available, return it. Otherwise, return the font that is closest in style.

Parameters

- **weight** (**FontWeight**) – weight of the font
- **slant** (**FontSlant**) – slant of the font
- **width** (**FontWidth**) – width of the font

Returns

Font – the requested font
