Paragraphs contain text and may contain inline markup: emphasis, strong emphasis, inline literals, standalone hyperlinks (http://www.python.org), hyperlinks (Python), external cross-references internal (example), external hyperlinks with embedded URIs (Python web site), footnote references (manuallv numbered<sup>1</sup>. anonymous auto-numbered<sup>2</sup>, labeled auto-numbered<sup>3</sup>, or symbolic<sup>4</sup>), and substitution references ( ). Character-level inline markup is also possible (although exceedingly ugly!) reStructuredText. **Problems** are indicated by problematic text (generated by processing errors; this one is intentional).

The default role for interpreted text is *Title Reference*. Here are some explicit interpreted text roles: a PEP reference (PEP 287); an RFC reference (RFC 2822); a subscript; a superscript; and explicit roles for *standard* **inline** markup.

<sup>1</sup> A footnote contains body elements, consistently indented by at least 3 spaces.

<sup>2</sup> This footnote is numbered automatically and anonymously using a label of "#" only.

<sup>3</sup> Footnotes may be numbered, either manually (as in <sup>1</sup>) or automatically using a "#"-prefixed label.

<sup>4</sup> Footnotes may also use symbols, specified with a "\*" label.
